# Chapter 1

## Main Page

Computer scientists are often required to conduct complex mathematical computations. This calculator is a program implementing functions to automate some of these computations.

### List of Implemented Functions

- Transpose matrix.
- Add two matrices.
- Multiply two matrices.
- Compute roots of quadratic polynomial.
- Compute factorial.

### Program Execution

To execute this program cmake is required to be installed. Open a terminal and change into the directory of the `scientific_calculator`. Afterwards run the following commands.

```
cmake --build cmake-build-debug --target scientific_calculator -- -j 4
```

```
cmake-build-debug/scientific_calculator
```

### Scientific Calculator License

## Chapter 2

# Data Structure Index

### 2.1 Data Structures

Here are the data structures with brief descriptions:

<a href="#">Complex</a>	Struct representing a complex number consisting of a real and an imaginary number . . . . .	<a href="#">7</a>
<a href="#">Matrix</a>	Struct representing a two dimensional matrix . . . . .	<a href="#">8</a>

## Chapter 3

# File Index

### 3.1 File List

Here is a list of all documented files with brief descriptions:

<a href="#">calculator.c</a>	Calculator for scientific computing . . . . .	9
<a href="#">math_library.c</a>	Mathematical functions for scientific computing . . . . .	10
<a href="#">math_library.h</a>	Mathematical functions for scientific computing . . . . .	18

## Chapter 4

# Data Structure Documentation

### 4.1 Complex Struct Reference

Struct representing a complex number consisting of a real and an imaginary number.

```
#include <math_library.h>
```

#### Data Fields

- float [real](#)
- float [imag](#)

#### 4.1.1 Detailed Description

Struct representing a complex number consisting of a real and an imaginary number.

See also

[https://en.wikipedia.org/wiki/Complex\\_number](https://en.wikipedia.org/wiki/Complex_number) (last access: 23.05.2019)

#### 4.1.2 Field Documentation

##### 4.1.2.1 `imag`

```
Complex::imag
```

Member 'imag' represents the imaginary valued part of the complex number.

##### 4.1.2.2 `real`

```
Complex::real
```

Member 'real' represents the real valued part of the complex number.

The documentation for this struct was generated from the following file:

- [math\\_library.h](#)

## 4.2 Matrix Struct Reference

Struct representing a two dimensional matrix.

```
#include <math_library.h>
```

### Data Fields

- int [n\\_rows](#)
- int [n\\_columns](#)
- float \*\* [values](#)

### 4.2.1 Detailed Description

Struct representing a two dimensional matrix.

### 4.2.2 Field Documentation

#### 4.2.2.1 n\_columns

Matrix::n\_columns

Member 'n\_columns' represents the number of columns of the matrix.

#### 4.2.2.2 n\_rows

Matrix::n\_rows

Member 'n\_rows' represents the number of rows of the matrix.

#### 4.2.2.3 values

Matrix::values

Member 'values' is a double pointer containing the values of the matrix.

### See also

The documentation for this struct was generated from the following file:

- [math\\_library.h](#)

## Chapter 5

# File Documentation

### 5.1 calculator.c File Reference

Calculator for scientific computing.

```
#include "math_library.h"  
#include <stdio.h>  
#include <math.h>  
#include <stdlib.h>
```

Include dependency graph for calculator.c:

#### Functions

- int `main` ()  
*Main function for execution of scientific calculator.*

#### 5.1.1 Detailed Description

Calculator for scientific computing.

**Author**

Marek Herde

**Date**

23.05.2019

## 5.2 math\_library.c File Reference

Mathematical functions for scientific computing.

```
#include "math_library.h"  
#include <stdio.h>  
#include <stdlib.h>  
#include <math.h>
```

Include dependency graph for math\_library.c:

### Functions

- struct [Matrix](#) [create\\_matrix](#) (int n\_rows, int n\_columns)  
*Allocates and creates a matrix with given input dimensions.*
- struct [Matrix](#) [read\\_matrix](#) ()  
*Reads in a matrix entered by the user.*
- void [print\\_matrix](#) (struct [Matrix](#) matrix)  
*Prints input matrix.*
- struct [Matrix](#) [transpose\\_matrix](#) (struct [Matrix](#) m)  
*This functions transposes a given input matrix.*
- struct [Matrix](#) [add\\_matrices](#) (struct [Matrix](#) m\_1, struct [Matrix](#) m\_2)  
*This functions adds two given input matrices.*
- struct [Matrix](#) [multiply\\_matrices](#) (struct [Matrix](#) m\_1, struct [Matrix](#) m\_2)  
*This functions computes the product of two given input matrices.*
- float [poly\\_discriminant](#) (float a, float b, float c)  
*Computes the discriminant of a polynomial function of degree two.*
- int [factorial](#) (int n)  
*Computes the factorial of a positive integer.*

### 5.2.1 Detailed Description

Mathematical functions for scientific computing.

Author

Marek Herde

## Date

23.05.2019

This library contains several mathematical functions and a list of them is given below.

- Transpose matrix.
- Add two matrices.
- Multiply two matrices.
- Compute roots of quadratic polynomial.
- Compute factorial.

## 5.2.2 Function Documentation

### 5.2.2.1 add\_matrices()

```
struct Matrix add_matrices (
    struct Matrix m_1,
    struct Matrix m_2 )
```

This functions adds two given input matrices.

Denoting the matrix by resulting matrix by  $M$  and the input matrices by  $X$  and  $Y$ , the addition is described by  $M = X + Y$ .

#### Parameters

$m_{\_1}$	first matrix
$m_{\_2}$	second matrix

#### Returns

sum of the matrices 'm\_1' and 'm\_2'

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.2.2.2 create\_matrix()

```

struct Matrix create_matrix (
    int n_rows,
    int n_columns )
  
```

Allocates and creates a matrix with given input dimensions.

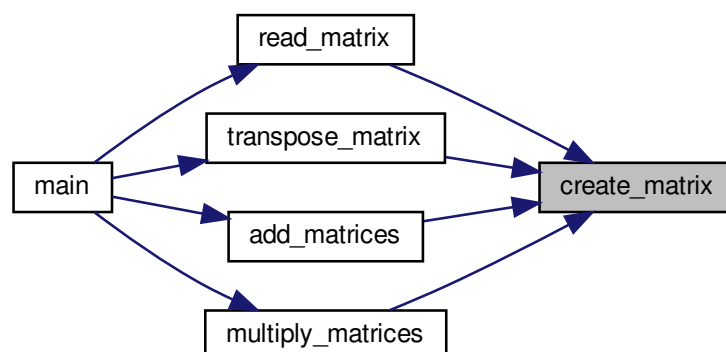

#### Parameters

<i>n_rows</i>	number of rows
<i>n_columns</i>	number of columns

#### Returns

created matrix

Here is the caller graph for this function:

### 5.2.2.3 factorial()

```
int factorial (  
    int n )
```

Computes the factorial of a positive integer.

#### Parameters

<i>n</i>	being a positive integer whose factorial is to be computed
----------	--

#### Returns

factorial of the parameter

#### See also

<https://en.wikipedia.org/wiki/Factorial> (last access: 23.05.2019)

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.2.2.4 multiply\_matrices()

```
struct Matrix multiply_matrices (  
    struct Matrix m_1,  
    struct Matrix m_2 )
```

This functions computes the product of two given input matrices.

Denoting the product matrix by  $M \in \mathbb{R}^{n \times m}$  and the input matrices by  $X \in \mathbb{R}^{n \times t}$  and  $Y \in \mathbb{R}^{t \times m}$ , the product is described by  $M = X \cdot Y$ .

## Parameters

$m_{\_1}$	first matrix
$m_{\_2}$	second matrix

## Returns

product of the matrices 'm\_1' and 'm\_2'

Here is the call graph for this function:

Here is the caller graph for this function:

## 5.2.2.5 poly\_discriminant()

```
float poly_discriminant (
    float a,
    float b,
    float c )
```

Computes the discriminant of a polynomial function of degree two.

A polynomial function of degree two is defined by  $f(x) = ax^2 + bx + c$ . The corresponding discriminant is given by  $b^2 - 4ac$ .

## Parameters

$a$	coefficient of polynomial of second order
$b$	coefficient of polynomial of first order
$c$	coefficient of polynomial of zeroth order

**Returns**

discriminant of polynomial function

**See also**

<https://en.wikipedia.org/wiki/Discriminant>

Here is the caller graph for this function:

**5.2.2.6 print\_matrix()**

```
void print_matrix (
    struct Matrix m )
```

Prints input matrix.

**Parameters**

<i>m</i>	matrix to be printed
----------	----------------------

Here is the caller graph for this function:

**5.2.2.7 read\_matrix()**

```
struct Matrix read_matrix ( )
```

Reads in a matrix entered by the user.

**Returns**

entered matrix

Here is the call graph for this function:

Here is the caller graph for this function:

**5.2.2.8 transpose\_matrix()**

```
struct Matrix transpose_matrix (  
    struct Matrix m )
```

This functions transposes a given input matrix.

Denoting the input matrix by  $M$ , the transpose  $M^T$  is returned.

**Parameters**

$m$	matrix to be transposed
-----	-------------------------

**Returns**

transposed matrix

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.3 math\_library.h File Reference

Mathematical functions for scientific computing.

This graph shows which files directly or indirectly include this file:

#### Data Structures

- struct [Complex](#)  
*Struct representing a complex number consisting of a real and an imaginary number.*
- struct [Matrix](#)  
*Struct representing a two dimensional matrix.*

## Functions

- struct `Matrix` `create_matrix` (int n\_rows, int n\_columns)  
*Allocates and creates a matrix with given input dimensions.*
- struct `Matrix` `read_matrix` ()  
*Reads in a matrix entered by the user.*
- void `print_matrix` (struct `Matrix` m)  
*Prints input matrix.*
- struct `Matrix` `transpose_matrix` (struct `Matrix` m)  
*This functions transposes a given input matrix.*
- struct `Matrix` `add_matrices` (struct `Matrix` m\_1, struct `Matrix` m\_2)  
*This functions adds two given input matrices.*
- struct `Matrix` `multiply_matrices` (struct `Matrix` m\_1, struct `Matrix` m\_2)  
*This functions computes the product of two given input matrices.*
- float `poly_discriminant` (float a, float b, float c)  
*Computes the discriminant of a polynomial function of degree two.*
- int `factorial` (int n)  
*Computes the factorial of a positive integer.*
- float `sine` (float angle)  
*Use brief, otherwise the index won't have a brief explanation.*

### 5.3.1 Detailed Description

Mathematical functions for scientific computing.

Author

Marek Herde

Date

23.05.2019

This library contains several mathematical functions and a list of them is given below.

- Transpose matrix.
- Add two matrices.
- Multiply two matrices.
- Compute roots of quadratic polynomial.
- Compute factorial.

### 5.3.2 Function Documentation

#### 5.3.2.1 add\_matrices()

```
struct Matrix add_matrices (
    struct Matrix m_1,
    struct Matrix m_2 )
```

This functions adds two given input matrices.

Denoting the matrix by resulting matrix by  $M$  and the input matrices by  $X$  and  $Y$ , the addition is described by  $M = X + Y$ .

**Parameters**

$m_{\leftarrow 1}$	first matrix
$m_{\leftarrow 2}$	second matrix

**Returns**

sum of the matrices 'm\_1' and 'm\_2'

Here is the call graph for this function:

Here is the caller graph for this function:

**5.3.2.2 create\_matrix()**

```

struct Matrix create_matrix (
    int n_rows,
    int n_columns )
  
```

Allocates and creates a matrix with given input dimensions.

**Parameters**

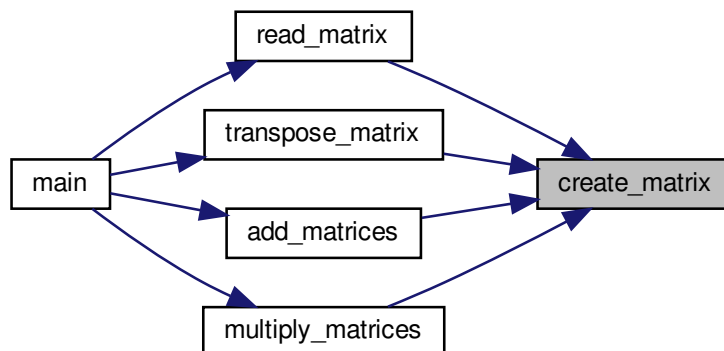

<i>n_rows</i>	number of rows
<i>n_columns</i>	number of columns

**Returns**

created matrix

Here is the caller graph for this function:

**5.3.2.3 factorial()**

```
int factorial (  
    int n )
```

Computes the factorial of a positive integer.

**Parameters**

<i>n</i>	being a positive integer whose factorial is to be computed
----------	--

**Returns**

factorial of the parameter

See also

<https://en.wikipedia.org/wiki/Factorial> (last access: 23.05.2019)

Here is the call graph for this function:

Here is the caller graph for this function:

#### 5.3.2.4 multiply\_matrices()

```

struct Matrix multiply_matrices (
    struct Matrix m_1,
    struct Matrix m_2 )

```

This functions computes the product of two given input matrices.

Denoting the product matrix by  $M \in \mathbb{R}^{n \times m}$  and the input matrices by  $X \in \mathbb{R}^{n \times t}$  and  $Y \in \mathbb{R}^{t \times m}$ , the product is described by  $M = X \cdot Y$ .

##### Parameters

$m_{\_1}$	first matrix
$m_{\_2}$	second matrix

**Returns**

product of the matrices 'm\_1' and 'm\_2'

Here is the call graph for this function:

Here is the caller graph for this function:

**5.3.2.5 poly\_discriminant()**

```
float poly_discriminant (
    float a,
    float b,
    float c )
```

Computes the discriminant of a polynomial function of degree two.

A polynomial function of degree two is defined by  $f(x) = ax^2 + bx + c$ . The corresponding discriminant is given by  $b^2 - 4ac$ .

**Parameters**

<i>a</i>	coefficient of polynomial of second order
<i>b</i>	coefficient of polynomial of first order
<i>c</i>	coefficient of polynomial of zeroth order

**Returns**

discriminant of polynomial function

See also

<https://en.wikipedia.org/wiki/Discriminant>

Here is the caller graph for this function:

#### 5.3.2.6 `print_matrix()`

```
void print_matrix (
    struct Matrix m )
```

Prints input matrix.

##### Parameters

<i>m</i>	matrix to be printed
----------	----------------------

Here is the caller graph for this function:

#### 5.3.2.7 `read_matrix()`

```
struct Matrix read_matrix ( )
```

Reads in a matrix entered by the user.

**Returns**

entered matrix

Here is the call graph for this function:

Here is the caller graph for this function:

**5.3.2.8 sine()**

```
float sine (  
    float angle )
```

Use brief, otherwise the index won't have a brief explanation.

Detailed explanation.

**5.3.2.9 transpose\_matrix()**

```
struct Matrix transpose_matrix (  
    struct Matrix m )
```

This functions transposes a given input matrix.

Denoting the input matrix by  $M$ , the transpose  $M^T$  is returned.

**Parameters**

$m$	matrix to be transposed
-----	-------------------------

**Returns**

transposed matrix

Here is the call graph for this function:

Here is the caller graph for this function:
